Tropical air cooled chillers 50&60Hz

## COMMERCIAL AIR CONDITIONERS

# Tropical air cooled chillers 50&60Hz

# Midea CAC (MCAC)

As a key subsidiary of Midea Group, the Midea Central Air Conditioner (MCAC) business unit has emerged as a leading supplier of commercial solutions. Since 1999 MCAC has contributed to the R&D and innovation of technologically-based commercial solutions. Cooperation with leading global enterprises coupled with independent R&D has enabled MCAC to implement thousands of commercial air-conditioning projects worldwide.

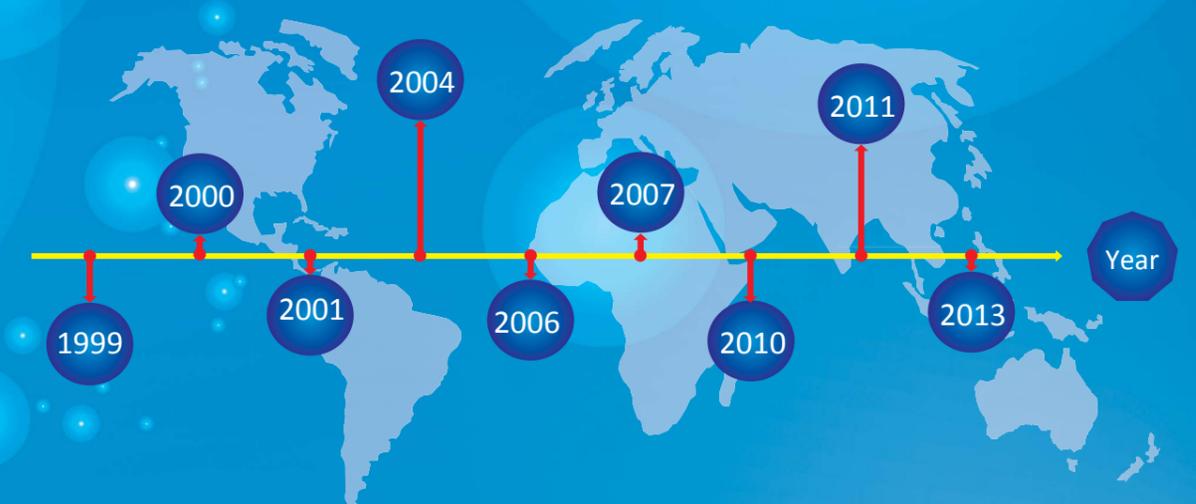

At present, MCAC is one of the globally leading product suppliers, underpinned by a mature marketing, sales, and project design framework.

There are three production bases in Shunde, Chongqing and Hefei.

MCAC Shunde: 38 product lines focusing on VRF (DC inverters and digital scroll products), split products, heat pump water heaters, and AHU/FCU.

MCAC Chongqing: 14 product lines focusing on water cooled centrifugal/screw/scroll chillers, air cooled screw/scroll chillers, and AHU/FCU.

MCAC Hefei: 11 product lines focusing on VRF, chillers, and heat pump water heaters.

- 2013 Launched the super high efficiency centrifugal chiller with full falling film technology
- 2011 Launched the DC inverter V4 Plus globally
- 2010 Built the 3<sup>rd</sup> manufacturing base in Hefei
- 2007 Won the first Midea centrifugal chiller project oversea
- 2006 Launched the first VSD centrifugal chiller
- 2004 Acquired MGRE entered the chiller industry
- 2001 Partnered with Copeland to develop the digital scroll VRF system
- 2000 Developed the first inverter VRF With Toshiba
- 1999 Entered the CAC field

# Midea air cooled chillers

Midea tropical air-cooled chiller adopts air as the cooling/heating source and water as the cooling/heating medium to cooling/heating the indoor ambient temperatures through the indoor terminals (AHU/FCU). It includes air cooled scroll chiller and air cooled screw chiller. The capacity range is from 25kW to 1200kW for one unit. The max capacity output is up to 2000kW for combined air cooled scroll chiller,9600kW for combined air screw chiller. The chillers can be used in all types of climate,the wide selection of module makes it possible to build a system for any of the customers requirements.

## Aqua Tempo Power Series Air cooled scroll chiller 25~250kW

Refrigerate:R410A  
Compressor type: Digital scroll+fixed scroll  
Max combined quantity: 16  
Max combined capacity output:2000kW  
Evaporator type: Double pipe&shell and tube

## Aqua Force Series Air cooled screw chiller 380~1200kW

Refrigerate:R134a  
Compressor type: Screw  
Max combined quantity: 8  
Max combined capacity output:9600kW  
Evaporator type: Shell and tube

## Product introduction

Midea air-cooled scroll chiller adopts air as the cooling/heating source and water as the cooling/heating medium to cooling/heating the indoor ambient temperatures through the indoor terminal (AHU/FCU). Air cooled chiller typically have a lower initial investment and maintenance cost than water cooled system, it does not require a cooling tower, condenser water pump and associated condenser water chemical treatment system.

Modular design concept makes the application from single unit to multiple form systems to several thousand tons of installed capacity. Adopting high reliable and excellent efficiency system, Midea air cooled scroll chiller becomes one of the best choice for all kinds of air cooled projects. With the latest modular design technology, high efficiency V shape heat exchanger and precise gas flow control technology and digital compressor application, Midea air cooled scroll chiller system always work at the most high efficiency stage. Modular and compressor operation are adjusted by the real load requirement intelligently to keep the most economical working status. They are widely applied in school, hospital, shopping mall, office as well as the factory and manufacturing processing area.

## Nomenclature

**M G C T - F 30 W / R N1**

- **Refrigerant type**  
N1:R410A Omit for R22
- **Power Supply**  
R: 380~415V, 50Hz, 3Ph  
D: 220V, 60Hz, 3Ph  
P: 380V,60Hz,3Ph
- **Air cooled type**
- **Rated cooling capacity (kW)**
- **The special function code**  
D: Digital scroll  
F: Fixed scroll
- **Omit for T1 condition**  
T: T3 condition
- **The heat exchanger type**  
B: Shell and tube or double pipe  
C: Double pipe
- **Light chiller system**
- **Midea**

# Product lineup

# Features

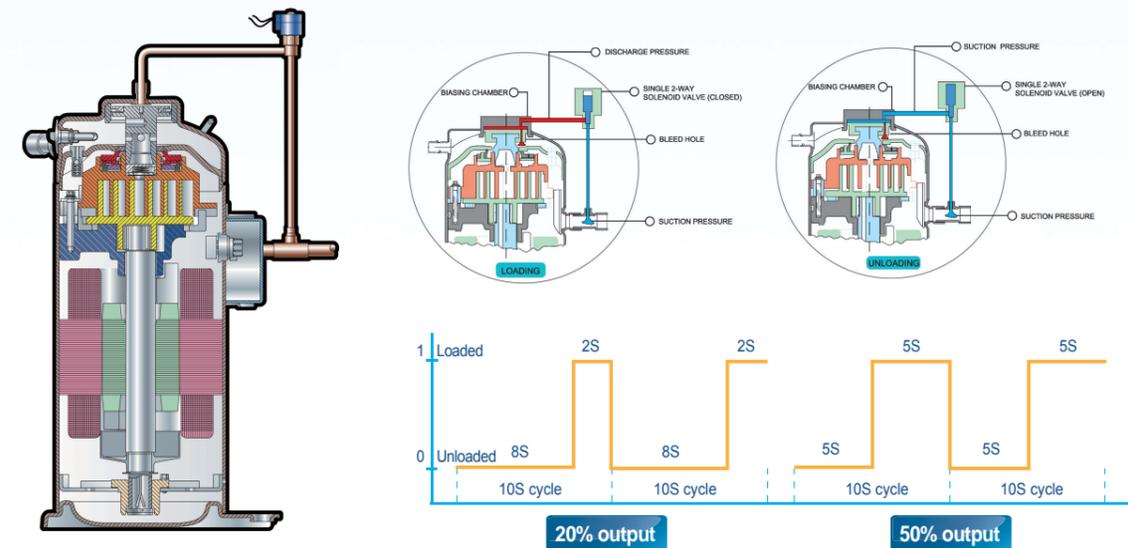

## Modular design

Modular design and mass production makes the stoke possible to short the delivery time to the project. Free capacity add-on in the future stage. Whole system reliability by the backup modular. Master controller oversees operation of all connected modules. Low starting current without any inrush to the power supply.

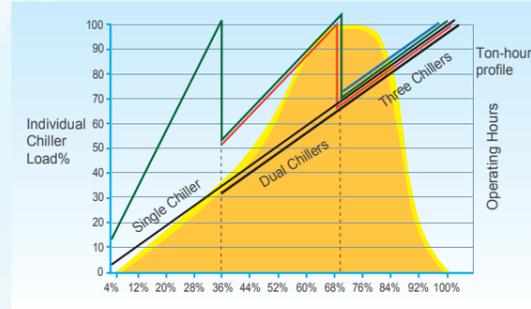

## Digital scroll technology

Digital scroll technology, provide maximum reliability, high efficiency and quiet operation. The widest capacity output can be achieved, comfort room temperature, efficiency of the whole system can be improved significantly. Advanced digital scroll technology for small modules (25/30/60kW) maximizes reliability, ensures efficient and silent operations, optimizes capacity output, and provides a comfortable room temperature.

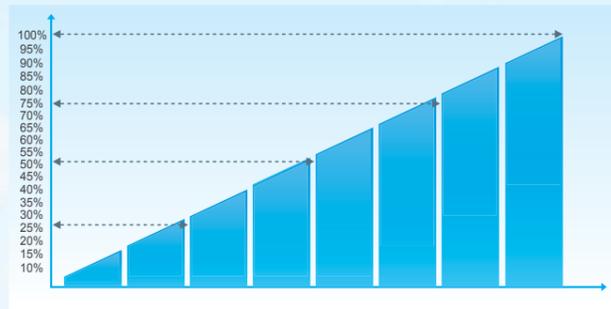

## Energy saving

In system the output capacity is proportional to the load of the building. In the partial load condition the single chiller system will operate at 10% to 70% which is a very low efficiency for a system and lead to a very low IPLV/NPLV. In a multiple system the system output capacity is not proportion to the load of the building and only one chiller will operate in the low efficiency area and other chiller will work in the high efficiency area. The IPLV/NPLV will be increased significantly by the modular design.

Example of three chillers operation profile

Stepless capacity control

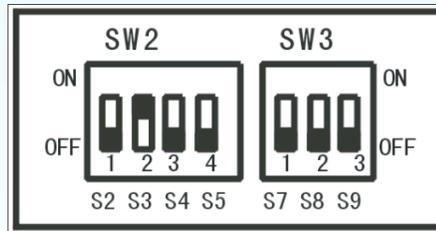

## Wide output water temperature

Cooling: 5~17°C (Set in factory), 0~17°C can be available by switch the S5 on PCB, the antifreeze must be put into pipeline.

Heating: 40~50°C (Set in factory), 22~50°C can be available by switch the address.

(Available for the module with the wired controller KJR-120A/MBE)

Mode		Outlet water temp.
Cooling	•Low outlet water temp. (S5 address ON)	0~17°C
	Normally (S5 address OFF)	5~17°C
Heating	Low outlet water temp. (S4 address ON)	22~50°C
	Normally (S4 address OFF)	40~50°C

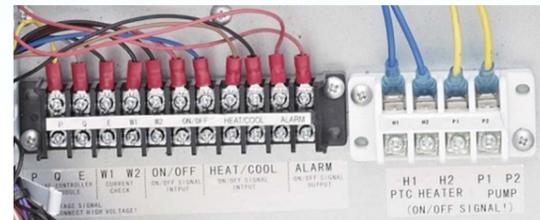

## User friendly remote control

Switch the S7 address on the PCB to ON to enable the following remote control operations:

- Remote ON/OFF.
- Remote mode selection for heating and cooling.
- Remote alarm.

Note:  
When use the remote control function, the wired controller will be invalid.

## Backup functions

When unit is failed.

- If master unit fails, all the units will stop.
  - If one slave unit fails, this unit will stop but the others will keep running.
  - When the master unit fails, any of the slave one can be set as the master unit by manual setting.
  - When unit is under protection.
  - If master unit's protection happens, this unit will stop but the others will keep running.
  - If slave unit's protection happens, this unit will stop but the others will keep running.
  - ( Except PE, P9 protection happens)
- PE: Low-temperature protection of evaporator.  
P9: Outlet and inlet water temperature difference protection.

## Optimized electrical design

The standardized hardware and program design efficiently manages raw materials via programming parameters written onto a EEPROM chip, which enables after-sales modifications, customization and troubleshooting. The electrical panels provide a clear visual representation of the wiring scheme completed during assembly.

# Mechanical specifications

## General information

All Midea air-cooled scroll chillers are factory tested by computer for ambient and water conditions and control operations.

Units are shipped with a full load of Zero Ozone Depletion Potential refrigerant R410a and oil.

Compressors, heat exchangers, condenser fans, piping and the control unit must be mounted on a heavy-gauge steel frame. Electrical controls, contactors, and relays are installed in each module.

Exposed steel surfaces are finished with a coat of powder paint, and all modules come with a heavy-gauge, galvanized steel power enclosure for outdoor installation.

R-410A

COOLING HEATING

EXV CONTROL

HERMETIC SCROLL

RELIABILITY

## Unit casing & construction

Unit cases are made from fabricated heavy-gauge galvanized steel. Each steel sheet panel is zinc coated and galvanized using the hot dip process to reach a lock-forming quality that complies with ASTM A 653 commercial weight G-90, and is then backed with an electrostatic polyester dry powder coat.

Condensing units come installed with refrigerant compressors, a condenser coil, propeller fans, control wiring, and piping.

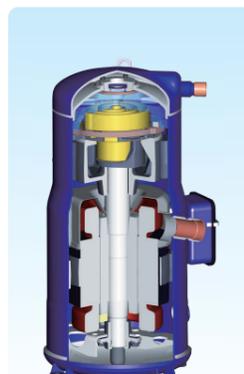

The unit includes a weather-resistant control panel ready for field connection to enable remote control functionality.

## Compressors

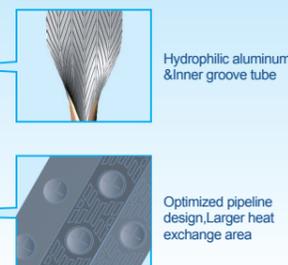

Standard hermetically sealed scroll compressors are used in all Midea air-cooled scroll chillers. Each compressor features internal motor protection, factory installed crankcase heaters, and rubber vibration isolators to ensure silent and efficient operations.

Each scroll compressor is cast in an iron frame and comes equipped with cast iron scrolls, three teflon bearings, and three oil filtration devices. The orbiting scrolls contact with just enough force to create a seal to ensure no friction exists between plates. Both the fixed and orbiting scrolls are made from high-strength cast iron to minimize thermal distortion and leaks and maximize efficiency.

Built-in vibration isolation, oil sump heating and a heat overload cut-out function, each compressor provides smooth and highly efficient functionality.

## Condenser coils

Hydrophilic aluminum & inner groove tube

Optimized pipeline design, Larger heat exchange area

The enhanced louvered fin and tube type V-shape condenser coils are seamlessly constructed to a diameter of 7.94mm.

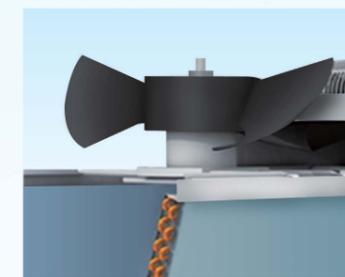

Inner-grooved copper tubes are mechanically bonded to aluminum fins for maximum heat transfer efficiency.

Each fin's self-spacing collar completely covers each tube, and the staggered tube design maximizes thermal efficiency.

The supporting end plates are heavy-gauge galvanized steel with extruding collars that optimize tube support and structural strength.

Each coil is pressure tested in the factory at not less than 450psi air pressure.

## Condenser fans

All fans are statically and dynamically balanced to operate at minimum noise and vibration. Fan blades are designed at an appropriate pitch angle to maximize airflow through the condenser and provide maintenance-free bearings for outdoor installation.

The fans are directly driven by a waterproof motor to ensure continuous operations. Each complies with the IP 54 safety class for long-term outdoor use. The fan guards are constructed of heavy gauge, rust-resistant, coated steel.

## Condenser fan motor

The condenser fans, impeller and motors form an integral unit. The fan motors are three-phase and provided with class F winding insulation and ball bearings for high ambient application.

## Crankcase heaters

Compressors with crankcase heaters remain powered-on during the de-energize process to protect the system against refrigerant migration, oil dilution and potential compressor failure.

## Evaporator

- Smaller modules under 35kW use a double pipe heat exchanger to minimize size; 60kW to 250kW models adopt shell and tube heat exchangers for easy maintenance.

- High efficiency, direct-expansion type coolers with refrigerant in tubes provide chilled liquid through the baffled shell without the oil return issue found in flood-type evaporators.

- Water baffles are fabricated from corrosion-resistant galvanized steel to resist corrosion. Water vents and drain connections are included.

- 20mm-thick insulation covers all low-temperature surfaces including the evaporator, water boxes, oil return lines and chilled water flow switch pipes.

Ambient temp	°C	Cooling: 10~52 Heating: -10~21				

Note: Specifications are based on the following conditions:

- Cooling : (\*1) chilled water inlet/outlet: 12°C/ 7°C, and outdoor ambient temp. of 35°C DB.  
(\*2) chilled water inlet/outlet: 12°C / 7°C, and outdoor ambient temp. of 46°C DB.
- Heating : warm water inlet/outlet: 40°C/ 45°C, and outdoor ambient temp. 7°C DB/6°C WB.
- Water side fouling factor: 0.086m<sup>2</sup>·°C/kW.
- 1m away in open field(sound pressure).

# System sketch drawing

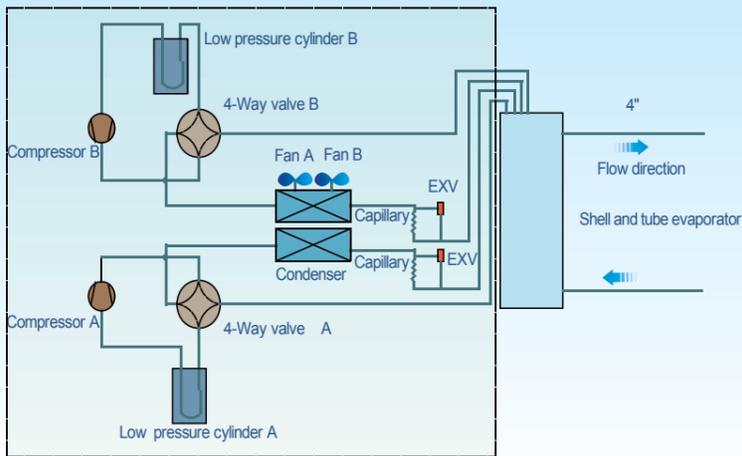

## 25/30kW module

Each module has two compressors with one separate unit, one double-pipe evaporator for two refrigerant systems.

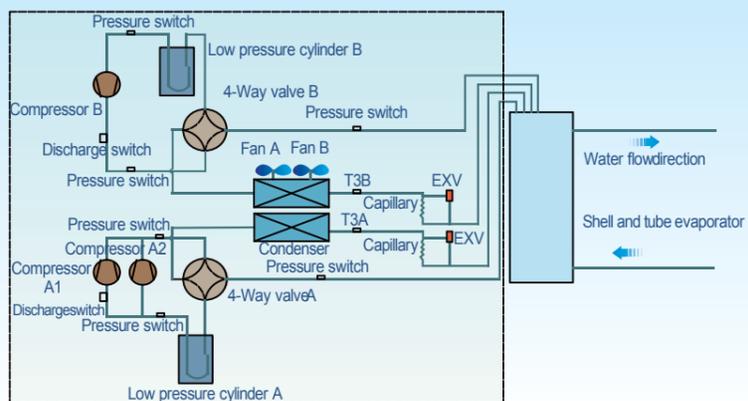

## 60kW module (Fixed speed)

Each module has two compressors with one separate unit, one shell and tube evaporator for two refrigerant systems.

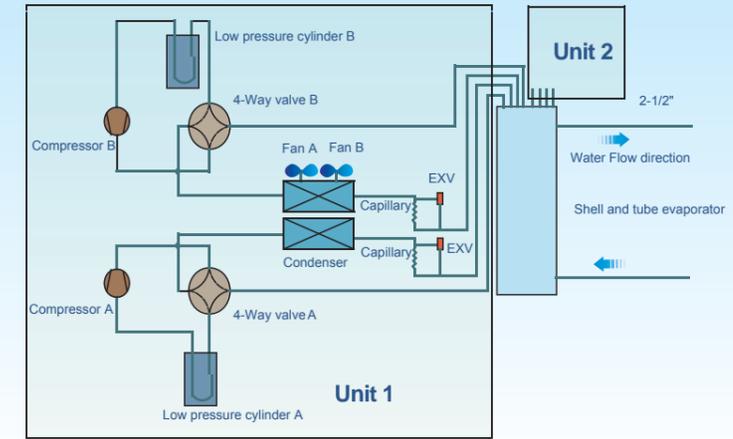

## 60kW digital module

Each module has three compressors with one separate unit, one shell and tube evaporator for two refrigerant systems.

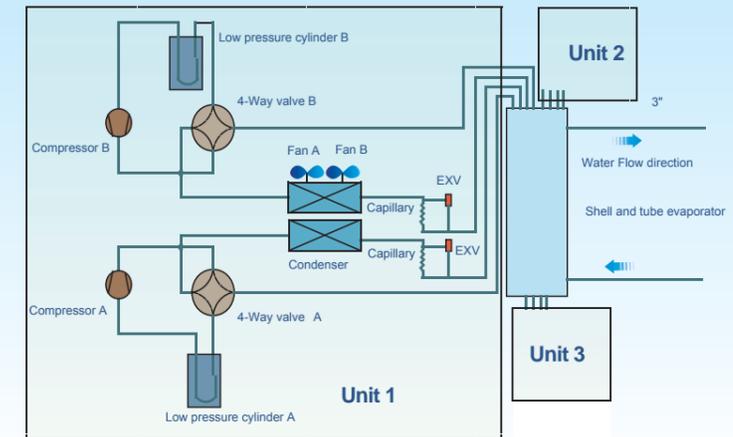

## 120kW module

Each module has four compressors with two separate units, one shell and tube evaporator for four refrigerant systems.

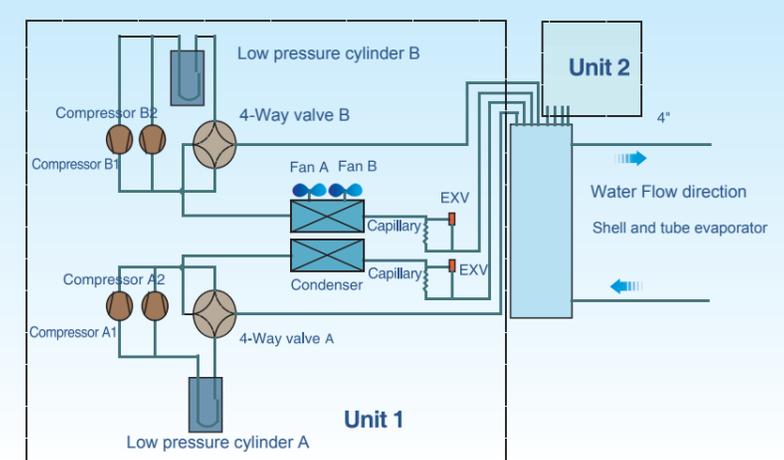

## 180kW module

Each module has six compressors with three separate units, one shell and tube evaporator for six refrigerant systems.

## 250kW module

Each module has eight compressors with two separate units, one shell and tube evaporator for four refrigerant systems.

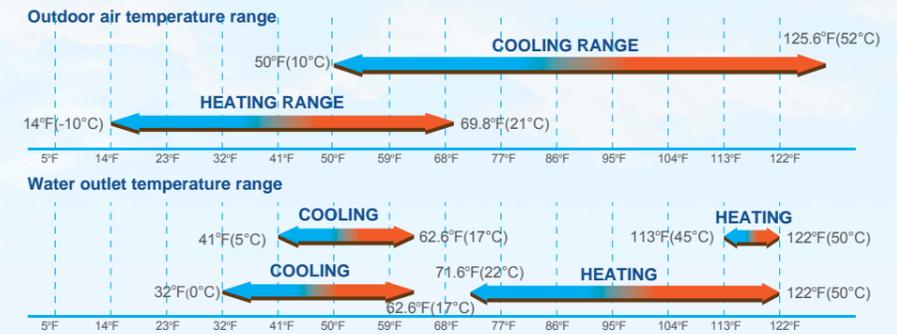

Application range →

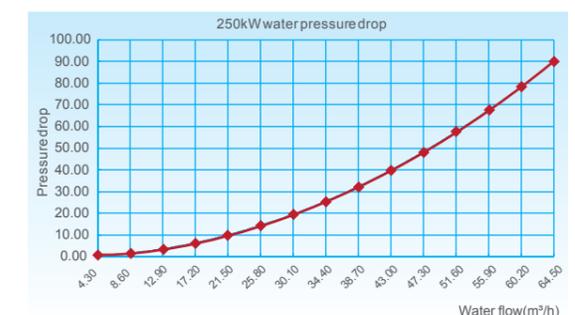

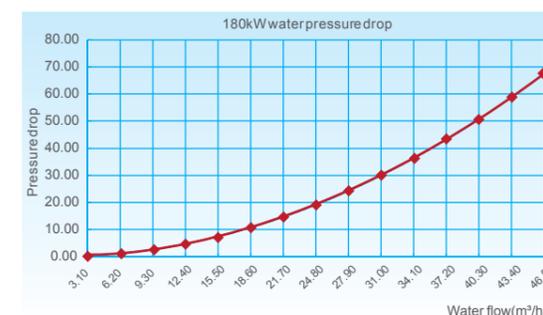

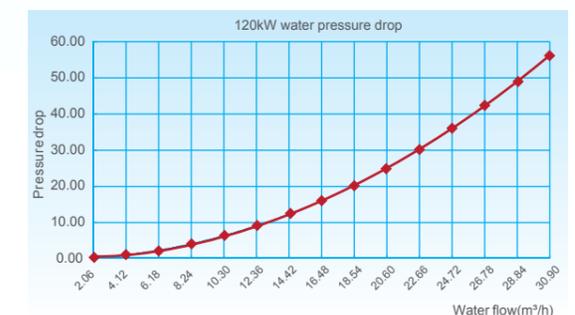

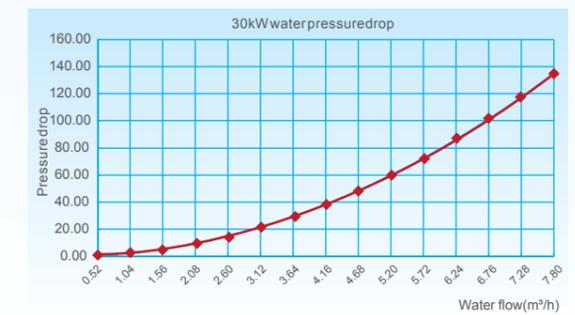

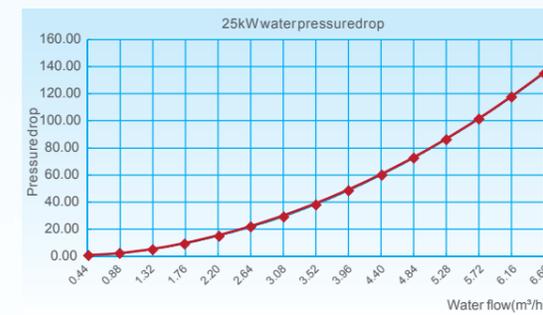

# Application range

## Operation temperature range

Air cooled scroll chiller

# Glycol factors

A glycol solution is required when the unit with condition as mentioned. The use of glycol will reduce the performance of the unit depending on concentration.

## Ethylene glycol

Quality of glycol (%)	modification coefficient				Freezing point °C
	Cooling capacity modification	Power modification	Water resistance	Water flow modification	
0	1.000	1.000	1.000	1.000	0
10	0.984	0.998	1.118	1.019	-4.000
20	0.973	0.995	1.268	1.051	-9.000
30	0.965	0.992	1.482	1.092	-16.000
40	0.960	0.989	1.791	1.145	-23.000
50	0.950	0.983	2.100	1.200	-37.000

## Propylene glycol

Quality of glycol (%)	Modification coefficient				Freezing point °C
	Cooling capacity modification	Power modification	Water resistance	Water flow modification	
0	1.000	1.000	1.000	1.000	0
10	0.976	0.996	1.071	1.000	-3.000
20	0.961	0.992	1.189	1.016	-7.000
30	0.948	0.988	1.380	1.034	-13.000
40	0.938	0.984	1.728	1.078	-22.000
50	0.925	0.975	2.150	1.125	-35.000

Units operating with glycol solutions are not included in the ARI Certification Program.

## Fouling factor

Fouling refers to the accumulation of unwanted material on solid surfaces, most often in an aquatic environment. The fouling material can consist of either living organisms (biofouling) or a non-living substance (inorganic or organic). Fouling is usually distinguished from other surface-growth phenomena in that it occurs on a surface of a component, system or plant performing a defined and useful function, and that the fouling process impedes or interferes with this function.

Other terms used in the literature to describe fouling include: deposit formation, encrustation, crudding, deposition, scaling, scale formation, slagging, and sludge formation. The last six terms have a more narrow meaning than fouling within the scope of the fouling science and technology, and they also have meanings outside of this scope; therefore, they should be used with caution.

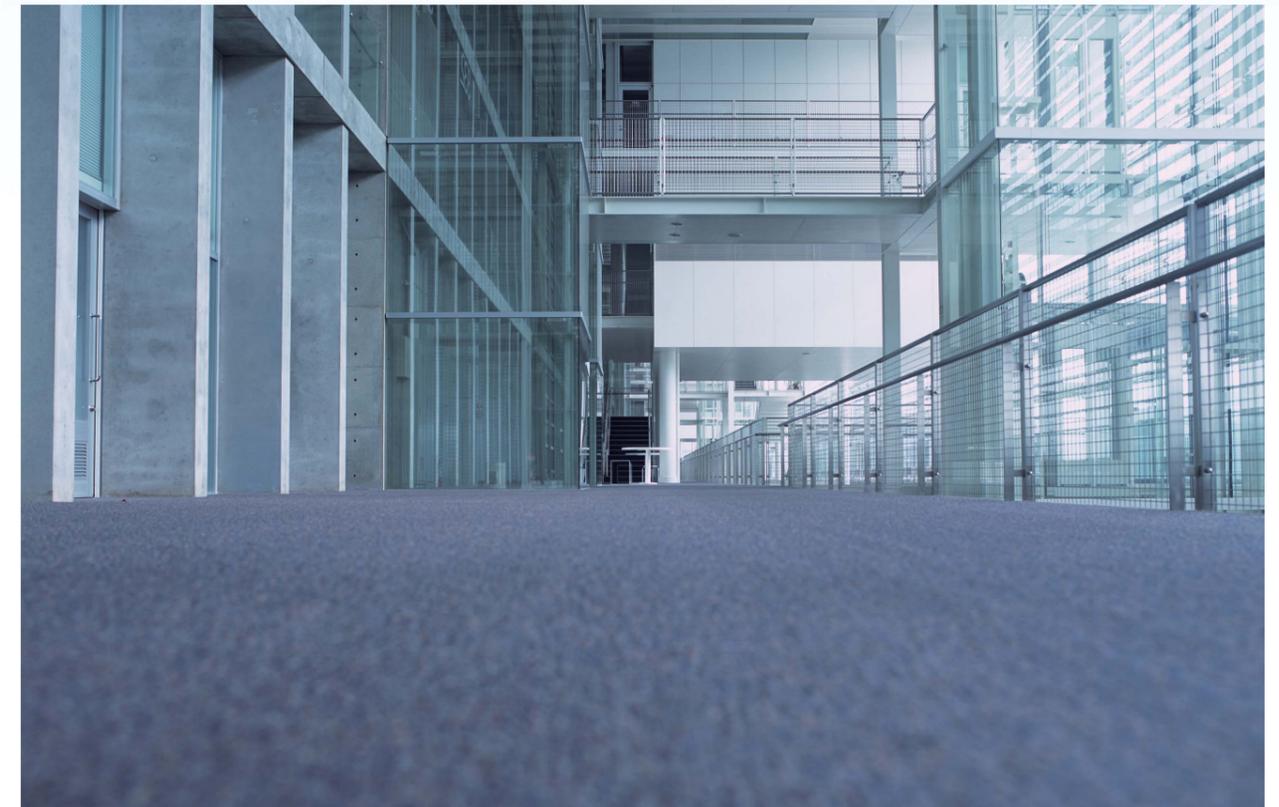

Fouling phenomena are common and diverse, ranging from fouling of ship hulls, natural surfaces in the marine environment (marine fouling), fouling of heat-transfer components through ingredients contained in the cooling water or gases, and even the development of plaque or calculus on teeth, or deposits on solar panels on Mars, among other examples.

Foreign matter in the chilled water system will adversely affect the heat transfer capability of the evaporator, and could increase the pressure drop and reduce the water flow. To provide optimum unit operation, proper water treatment must be maintained. Refer to the table as following.

## Fouling factor

ALTITUDE (m)	Difference of water inlet and outlet temp (°C)	Fouling Factor							
		0.018 °C /kW		0.044m 2 °C /kW		0.086m 2 °C /kW		0.172m 2 °C /kW

## Wired controller KJRM-120D/BMK-E(Standard)

The setting and operation order can be send to the main board and the running condition can be displayed by the wired controller. It can connect max. 16PCBs. It is available for all Midea air cooled scroll chillers.

The MODBUS gateway can be customized,it is available by communication port X,Y and E in wired controller.

Item	Description	Item	Description

## Wired controller KJR-120A/MBTE(Optional, with weekly timer)

The wired controller KJR-120A/MBTE is functional design, it is available for all Midea cooled scroll chiller, it can automatically adjust the module which is new or old to execute the related indicator. The main functions as following:

- Provide the timing startup function.
- The temp. difference between start up temperature and setting temperature (It can be adjusted,the range is 2,3,4,5°C (2°C is default)).
- Real-time timer function instead of relative time.
- Operation parameter checking button.
- Remote control icon display function.
- Malfunction manual reset.

Item	Description	Item	Description
1	Cooling mode.	8	Remote control is on or off.
2	Heating mode.	9	Display the units quantity on line/ON,OFF state.
3	Pump mode.	10	Display temp.,current,error codes,protection codes.
4	Normal running, the light is on.	11	Display the checking parameters(IA/IB/T3A/T3B).
5	The unit has error, the light is on.	12	Real time display./Week timing check and query display.
6	When querying, the light is on.	13	Display the week timing state. / The week timing set period display.
7	The electric heater works, the light is on.	14	Set week timing.

## Network control system

The intelligent network control system of the Midea air-cooled scroll chiller mainly comprises the RS485/232 converter, which can connect max. 16 wired controllers, each wired controller can control max. 16 PCBs.

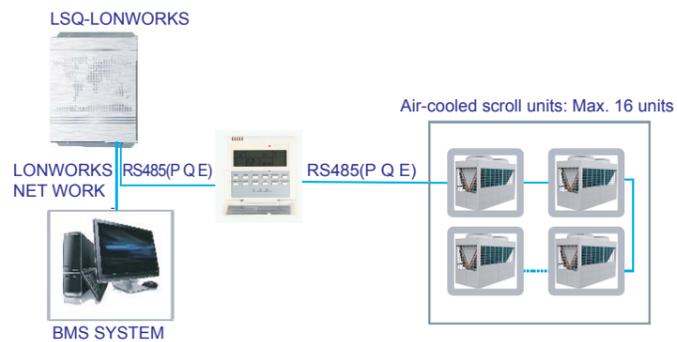

### Main functions:

- Controls the refrigeration system's operating mode.
- Queries operation parameters in the main and subsystems in real time.
- Provides a weekly timer for managing the refrigeration system.
- Records refrigeration system errors.

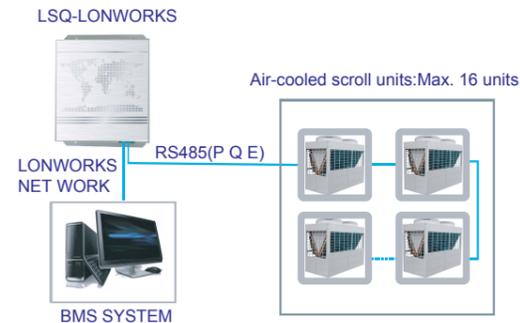

## LONWORKS gateway

The unit's LONWORKS gateway controls the central A/C to facilitate the building management system (BMS). LONWORKS provides four settings to control the air-cooled modules: Operation Mode, Outlet Water Temperature, Hysteresis, and Clear Alarm.

### Connection 1

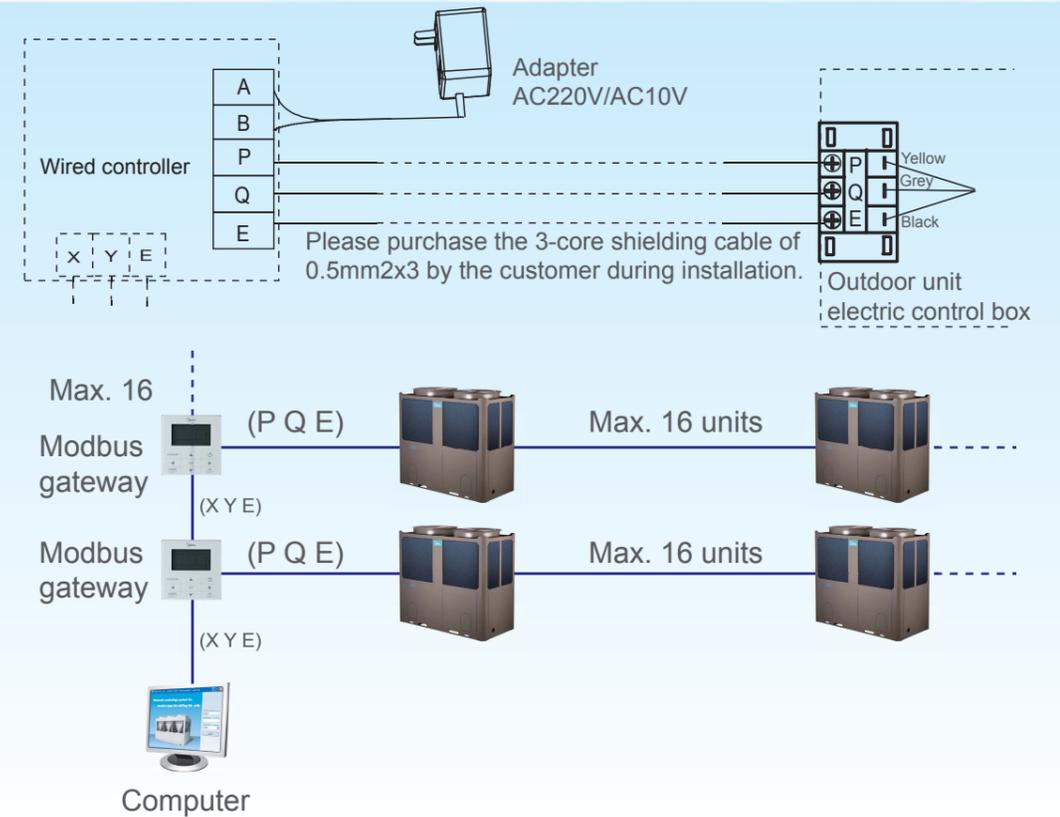

### Connection 2

## MODBUS gateway

The Modbus gateway can be customized, it realizes intelligent network control by X Y E ports. It can connect max. 16 wired controllers, each wired controller can control max. 16 PCBs.

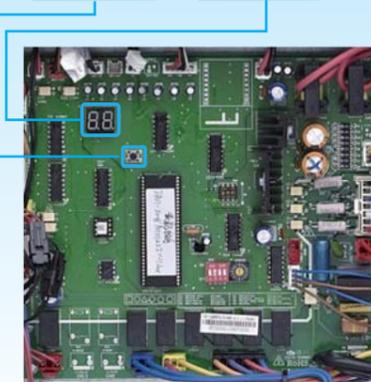

## Protection

The main board's LED shows all alarm and protection information. The chiller controller continually performs self-diagnostic checks; monitors the system's temperature, pressure and protection devices; it will automatically shut down faulty compressors, refrigerant circuits or the entire unit if a fault occurs.

- Users can press Check on the LED to display the system's operational status.
- The LED displays protection or error codes if either condition occurs.

### Check button LED display

Compressor current protection

Phase protection

## Error codes for fixed mouldle

No	Code	Trouble	No	Code	Trouble

11	EA	Main unit detected that auxiliary unit's quantity have decreased	28	PA	Starting protection of low-temperature cooling
12	EB	Anti-freezing temperature sensor 1 error in shell and tube exchanger	29	Pb	System anti-freezing protection
13	EC	Wired controller did not find out any on-line module unit	30	PC	(Reserved failure code)
14	ED	Wired controller and module unit communication error	31	PE	Low-temperature protection of shell and tube heat exchanger
15	Ed	1-hour consecutive 4-times PE protection	32	F1	EEPROM failure
16	EE	Wired controller and computer communication error	33	F2	Failure of reduction of wired controller number at parallel connection of multiple wired controller (reserved)
17	EF	Inlet water temperature sensor error			

## Error codes for digital module

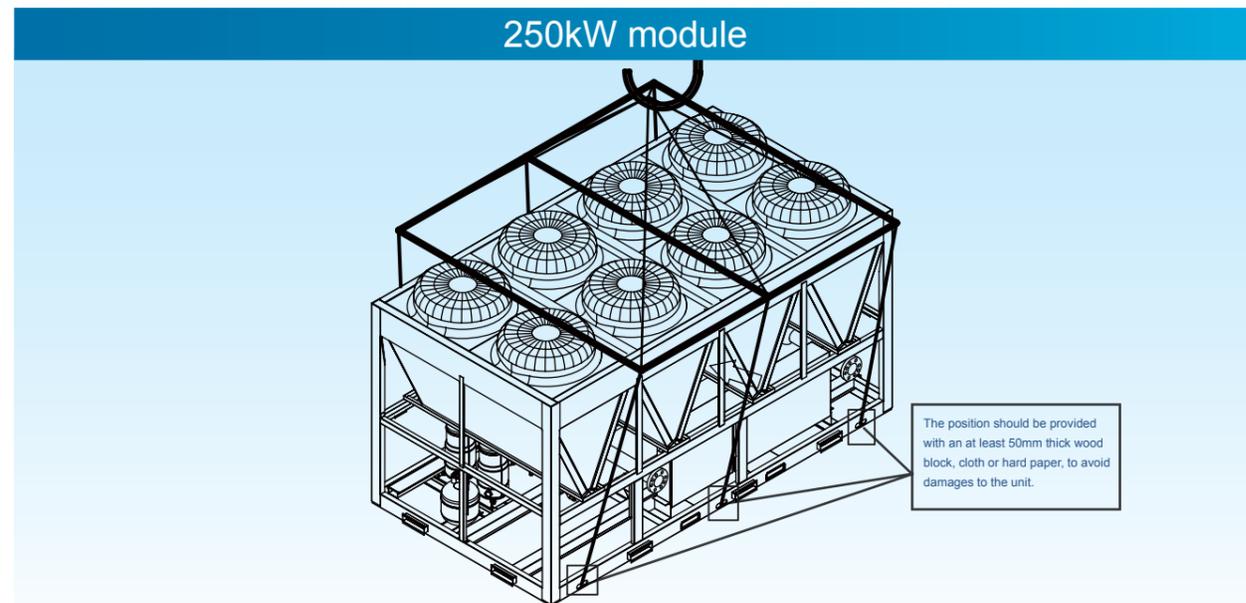

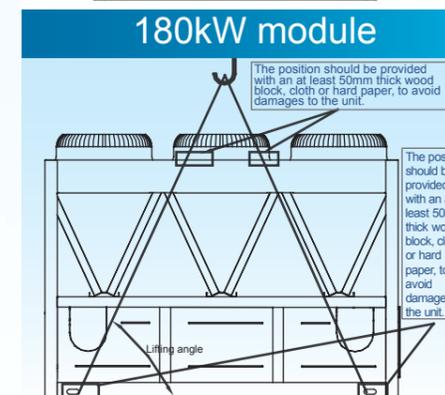

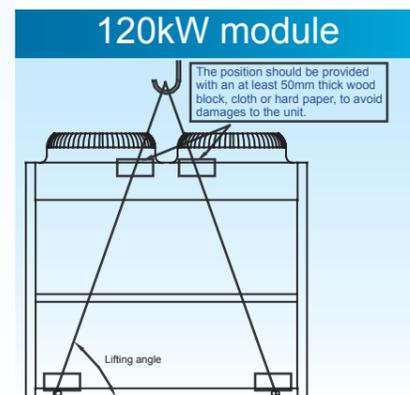

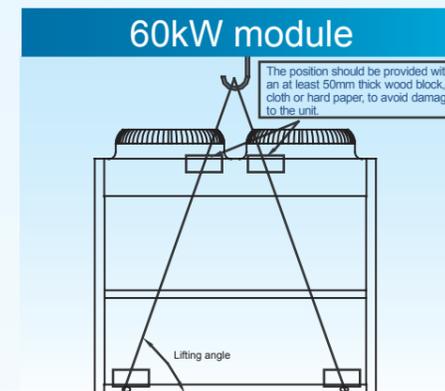

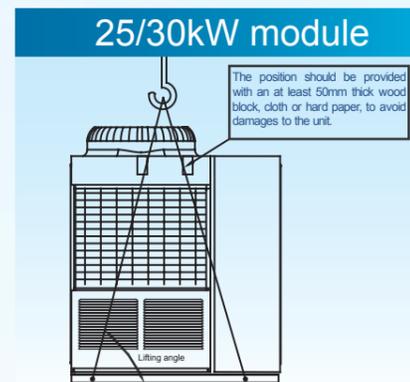

No	Code	Trouble	No	Code	Trouble
1	E0	EEPROM error	16	P0	High pressure or air discharge temperature protection in system A
2	E1	Power phase sequence error	17	P1	Low pressure protection in system A
3	E2	Communication error	18	P2	High pressure or air discharge temperature protection in system B
4	E3	Total water outlet temperature sensor error	19	P3	Low pressure protection in system B
5	E4	Outlet water temperature sensor error in heat exchanger	20	P4	Current protection in system A
6	E5	Pipe temperature sensor error in condenser A	21	P5	Current protection in system B
7	E6	Pipe temperature sensor error in condenser B	22	P6	Condenser high pressure protection in system A
8	E7	Outdoor ambient temperature sensor error or power supply protection	23	P7	Condenser high pressure protection in system B
9	E8	Output error of the power protector	24	P8	(Reserved failure code)
10	E9	Water flow detection error	25	P9	Outlet and inlet water temperature difference protection
11	EA	(Reserved failure code)	26	PA	Low ambient temperature drive-up protection
12	Eb	Anti-freezing temperature sensor 1 error in shell and tube exchanger	27	Pb	System anti-freezing protection
13	EC	Wired controller detected that the units on-line have decreased	28	Pc	Anti-freezing pressure protection in system A
14	Ed	(Reserved failure code)	29	Pd	Anti-freezing pressure protection in system B
15	EF	Inlet water temperature sensor error	30	PE	Low-temperature protection of shell and tube heat exchanger

# Rigging instructions

The angle of inclination should not be more than 15° when carrying the unit, to avoid overturn of the unit.

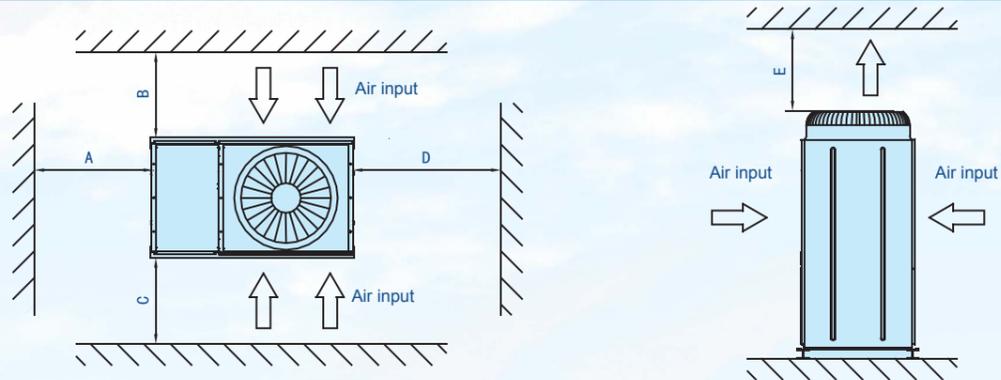

a. Rolling handling: several rolling rods of the same size are placed under the base of the unit, and the length of each rod must be more than the outer frame of the base and suitable for balancing of the unit.

b. Lifting: the strength lifting rope (belt) can bear should be 4 times the weight of the unit. Check the lifting hook and ensure that it is firmly attached to the unit, and the lifting angle should be more than 60°. To avoid damages to the unit, the contact position of the unit and lifting rope should be provided with an at least 50mm thick wood block, cloth or hard paper. Any person is not allowed to stand below the unit when lifting it.

With half century experience in chiller industry, Midea Chongqing chiller manufacturing base is becoming one of the largest chiller companies in China. It covers an area of 800 Mu (137 acre), with a registered capital of 12.5 million US \$ and a total investment of over 0.85 billion US\$. There are 6 product series and over 100 model products including centrifugal chillers, screw water chillers, scroll water chillers, water-cooled packaged units, and central air-conditioning indoor terminal devices(AHU/FCU). Five chiller manufacture shops with 14 flexible production lines lead a manufacturing capacity of 500 units centrifugal chillers, 1000 units of air cooled screw, 2000 units of water cooled screw and 200000 units of AHU products.

Strong R&D and manufacturing capacity makes Midea Chongqing general become the fastest developing company in chiller industry. The chiller test lab which is certified by China National Refrigeration Equipment Inspection Center gets the largest refrigeration test capacity in Asia. The engineer team with 100 top engineers and international chiller experts who are working many years in structure, electricity, and performance testing and software aspect make Midea the headship in chiller industry. In the year of 2011 Midea CAC invested another 150 million RMB for test lab as ARI test stand, big capacity air cooled screw life span testing room, 1500kW compressor motor test lab etc.

Concentrating on energy-saving and environment protection, Midea Chongqing chiller factory commits itself to the reliable and high efficiency products for the world. The chiller products are widely used in different countries and obtain good public praise from the clients. The solutions for the Beijing capital international airport, Jakarta international airport, China rapid transit station win good feedback and commendation. Continuing with the past and opening up the future, Midea chiller brand will go further and create an illustrious future.

#### 8800kW water cooled chiller performance testing stand

The 8800kW water chilled chiller testing stand is one of the most advanced testing facilities in the world. It is able to simulate all the chiller running condition like Chinese National standard condition (7/12℃, 30/35℃). Chinese industry condition (7/12℃, 32/37℃). AHRI testing condition (6.7/12.2℃, 29.4/35℃). It provides all precise testing data for the IPLV and NPLV calculation. Every chiller will be tested in the stand before shipping.

#### 1500kW motor performance testing center

The 1500kW compressor motor testing lab used to simulate all the working condition for the actual situation. Provide the electrical correct factor for all the compressors. The cooling capacity range rang from 1200kW to 8800kW. Evaporating temperature range from -20℃ to 40℃ and condensing temperature range from 25℃ to 80℃. It is one of the most advanced testing facility in China.

#### 1200kW air cooled chiller performance testing lab

The 1200kW air cooled testing lab is one of the largest air cooled product testing lab. It can simulate all the actual ambient temperature range from -20℃ to 56℃. It ensure all the air cooled chiller product work reliably in all temperature condition. The 1200kW air cooled testing lab was certified by AHRI.

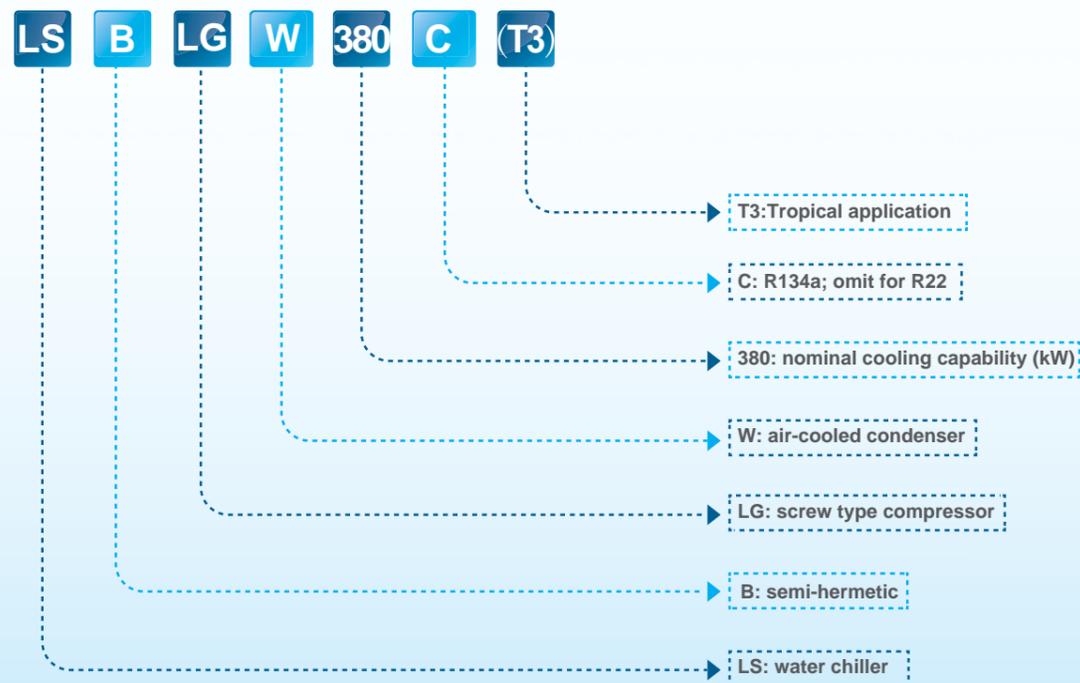

# Product Introduction

Air cooled screw chiller is a kind of central air-conditioning unit which adopts air as the cooling or (Heating) source and water as the cooling or (heating) medium to cool down or (heat ) the indoor ambient temperature through the indoor terminal(AHU/FCU). Midea air cooled screw chillers are the premium solution for industrial and commercial applications where installation contractors, consultants and building owners require optimal performances and optimized quality. Air cooled chiller typically have a lower initial investment and maintenance cost than water cooled system since it does not require a cooling tower, condenser water pump, and associated condenser water chemical treatment system.

Midea air cooled screw chillers are designed to meet current and future requirements in terms of reliability, energy efficiency and intelligent control. We use the best technologies available today :Twin-rotor screw compressors with a variable capacity valve are ideally matched to coolers and condensers optimally configured for superior heat transfer and unit efficiency. They are widely applied in school, hospital, shopping mall, office as well as the factory and manufacturing processing area.

# Nomenclature

# Product lineup

# Features and benefits

## Environmental Care

- R134a environmental- friendly refrigerant  
Refrigerant of the HFC R134a group with zero ozone depletion potential.  
Very low GWP (Global Warming Potential)

## Lower refrigerant charge through the use of high-efficiency heat exchangers

- Leak-tight refrigerant circuit  
Reduction of leaks as no capillary tubes and flare connections are used.  
Verification of pressure sensors and temperature sensors without transferring refrigerant charge  
Discharge shut-off valve for simplified maintenance.

## Low operating sound levels

- The twin-screw compressor adopts the strong points of gapless-loss, high- efficiency cubage, low-noise, few easy workout parts. Double-wall structure not only compensates the pressure, but also significantly reduces the noise. Cast iron casing and oil separator can reduce the noise significantly.
- Low-noise fans, made of a composite material are even quieter and do not generate intrusive low-frequency noise. Rigid fan mounting is preventing start-up noise.
- Multiple direct drive dynamically balanced propeller fans operate at low tip speeds for maximum efficiency and minimum noise and vibration. A heavy-gauge vinyl-coated fan guard protects each fan.

## Design flexibility

- Six basic capacity modules, wide array of module combination.
- Standard module for flexible stock and fast delivery.
- Field-coupled to meet large project tonnage requirements.
- Low initial investment and maintenance cost.

## User-friendly

- Touchable screen display , Color coded, easy for operation.
- Three status indicators on the screen which include power, status and communication .
- Liquid crystal 40 character display with text provided on two lines and light emitting diode backlighting for outdoor viewing

## High accuracy micro-control

- The newest advanced microprocessor controller. This controller monitors analog and digital inputs to achieve precise control & protective functions of the air cooled water chiller units. This microprocessor controller is complete with all the hardware and software necessary to control the chiller unit and ensure its efficiency and reliability.
- Intelligent control: The unit is controlled by micro-controller(PLC) with has the automatic control functions of fault diagnosis, energy management and anti-freezing monitoring ensure the high-efficiency operation and more convenient in use.
- The unit with RS485 open protocol communication interface is BMS compatible. The startup and shutdown of each unit is controlled by the host computer, reducing the running cost to the lowest.
- Complete and safe control system: All electrically control elements are designed and selected with stable quality and reliable function; The unit designed with multiple security measures ensure the safe and reliable running
- The sensors related to control and other assemblies are equipped by factory and strictly tested.

## Absolute reliability, very economical operation

- Bizer brand twin-rotor screw compressor equipped with a high-efficiency motor
- Electronic expansion device permitting operation at a lower condensing pressure and improved utilisation of the cooler heat exchange surface (superheat control)
- Fully factory testing of all the units ensures a trouble free start-up. The unit has passed full factory test before being delivered to ensure the reliable working on the site.

## Easy and fast installation

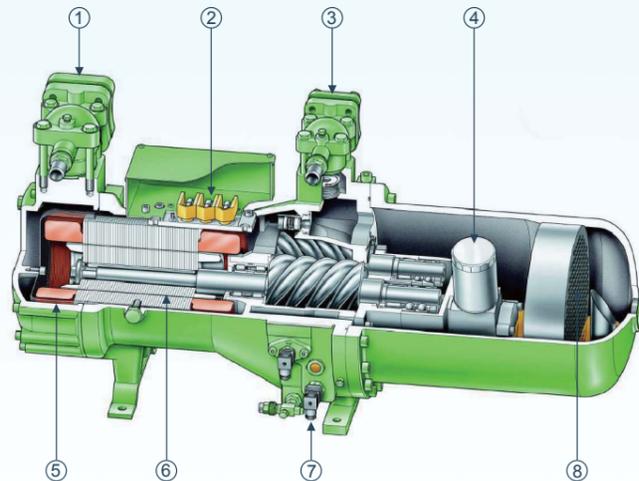

- Compact size and module design save the transportation, lifting and installation cost
- The unit can be placed in service after being connected with power supply and water supply during field installation .

# Mechanical components

## Advanced twin-rotor screw compressor

- Midea® air screw chiller is equipped with the 3rd generation industrial semi-hermetic screw compressor which with the latest advanced 5-6 asymmetry dentiform rotors. The rotors are processed by high-precision CNC and each part is well-proportioned and none-gap matching, which minimizes the friction resistance and clearance lost, guarantees quiet running and good duration.
- The compressor motor is direct drive type with two poles to operate at 2960 rpm (50HZ) input speed. It is non-reversing, squirrel cage induction type suitable for the voltage shown on the equipment schedule. Compressors combined an balance piston with separated radial and axial force bearings, oil cooler connector, liquid injection & economizer connector, PTC motor coil protection and discharge temperature & it's controller, oil level switch and oil pressure differential switch, oil sight glass, oil strainer, crank case heater and other accessories. The bearing of compressor is from SKF, Sweden gurantee the continuously runing more than 60,000 hours.

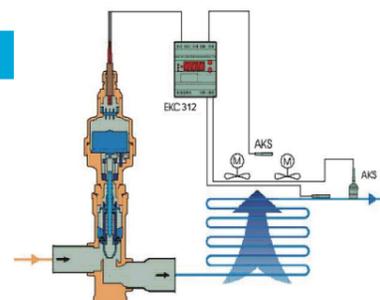

- ① Suction cut-off valve
- ② Solenoid valve
- ③ Discharge cut-off valve
- ④ Oil filter
- ⑤ Suction filter net
- ⑥ Motor
- ⑦ Oil heater
- ⑧ Oil separator filter net

## Condenser

- Air cooled condenser coil consist of staggered rows of seamless inner groove copper tube, mechanically expanded onto the die formed aluminum fin to ensure optimum heat exchange capability.
- Grooved condenser fin and tube condenser coils of seamless, internally enhanced, high condensing coefficient, corrosion resistant copper tubes arranged in staggered rows and mechanically bonded to corrosion resistant aluminum alloy fins with full height fin collars.
- The fins have full self spacing collars which completely cover each tube. Blue fin and black epoxy-coated aluminum fin are options.

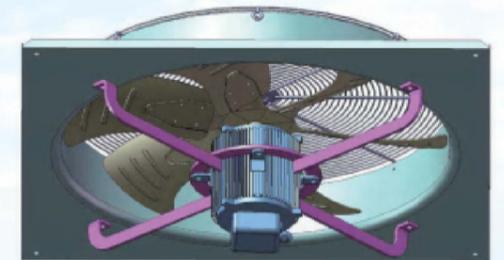

## Throttling device

- Famous brand electronic expansion valve which control by drive module control.
- The drive module controller controls the valve according to cooler suction superheat.
- PID arithmetic control the open degree of the valve.

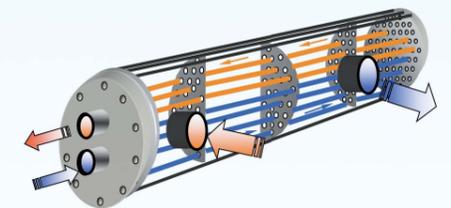

## Fan

- The adoption of advanced new-type low-speed blade profile and quantic load distribution in the blade design, which improves the cross section and radial shape of the blade. Compared to the performance of the blade products of commonly used profile, the blade of fans is of relatively larger lift coefficient and lift-drag ratio, and the fan offers higher wind pressure, larger air delivery and obviously higher efficiency.
- Condenser Fans with low noise, full airfoil cross section for maximum efficiency, statically and dynamically balanced for low vibration operation, and positioned in extended, formed steel orifices for low sound and maximum efficiency.
- All fan motors shall be three phase with class "F" winding insulation and ball bearings for high ambient application.

## Evaporator

- Cooler is shell-tube heat exchanger design, with internally-finned copper tubes roller expanded into the tube sheet. Units are fabricated with high-performance tubing, steel shell & tube sheets. Water boxes are nozzle-in-head type with victaulic for easy connections.
- High efficiency, direct-expansion type cooler with refrigerant in tubes and chilled liquid through the baffled shell.
- Water baffles fabricated from galvanized steel to resist corrosion. Removable heads allow access to internally-enhanced, seamless, copper tubes. Water vent and drain connections including.
- The 20MM thickness insulation covers all low temperature surfaces include the cooler, water box, oil return line, chilled water flow switch piping etc.

Shell and tube heat exchanger (cooler)	Water side		Refrigerant side	
	Design pressure, (bar/psig)	Test pressure, (bar/psig)	Design pressure, (bar/psig)	Test pressure, (bar/psig)
Standard	10/147	12.5/188	18/265	19.8/291
Option	16/235	20/294	18/265	19.8/291

## Refrigerant circuit

- Independent refrigerant circuit per compressor, each using copper refrigerant pipe formed on computer controlled bending machines. Less piping brazed joints result in a highly reliable and leak resistant system.
- Liquid line components include: Manual shut-off valve with charging port, high adsorption removable core filter-drier, solenoid valve, sight glass with moisture-indicator, and reliable electronic expansion valves for R134a.

## Microprocessor controls

The microprocessor controller on the state of art microprocessor technology. This controller monitors analog and digital inputs to achieve control & safety functions of the unit. The control system is module-designed, easy for installation and maintenance. The chiller which reserved with RS485 port can be interfaced with BAS (Building Automation system). The remote monitoring and control of the chiller is possible.

### Touch screen information

The display of control regulation and operating parameters, diagnostics, and error messages is a 7 inch, 65636 colors TFT displayer with 800 X 480 distinguish ability. The screen can display error codes, settings of various set points, specified temperature and pressure values, and the status of operating parameters and options.

### >>> Power-down memory function

When power-down, the chiller will maintain preceding running mode and parameter set point.

### >>> Weekly operation scheduling

The user can set the chiller operation schedule in the weekly timetable to run and stop the chiller automatically. If a sudden power outage, the chiller will not restart until manual reset.

### >>> Data acquisition & storing

Max. 256 records of latest alarms and 500 seconds chilled/cooling water temperature trend display.

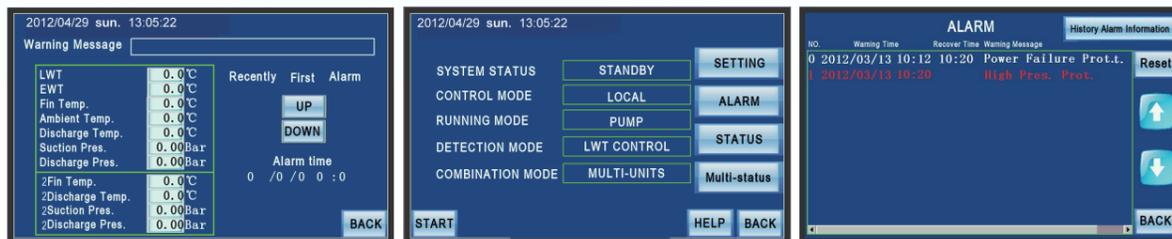

### >>> Self-diagnosis

Self-diagnosis is always performed before start-up to enable safe operation. Only all the requirements get satisfied, the chiller will start.

Multiple self-protecting functions guarantee the safety of unit and running perfectly.

### >>> Easily accessible measurements :

- Suction and discharge temperatures
- Suction & discharge pressures
- Compressor capacity adjustment status
- Ambient temperature
- Water inlet/Outlet temperatures
- Fan status

### Multiple self-protections functions:

High/low pressure protection	Guarantee the Comp. running in the right range and its lifespan
Anti-freezing protection under cooling mode	Protect the copper pipes of evaporator from damage due to water freeze
Frequent startup protection	Protect Comp. from getting burned by the overheated winding due to frequent startup
Overheat protection of compressor	Protect Comp. from damage due to lack of refrigerant or lubricant oil
Water flow protection	Protect Comp. from getting burned due to failure of heat-exchange

# Standard control & safety devices

**MICROPROCESSOR CONTROLLER:** This controller monitors analog and digital inputs to achieve precise control & safety functions of the unit.

**COMPRESSOR IN-BUILT PROTECTION DEVICE:** Protects the compressor by monitoring:

- A) Motor winding temperature in case of overload.
- B) Discharge gas temperature in case of overheating.
- C) Phase reversal for direction of rotation.

**CRANKCASE HEATERS:** Each compressor has immersion type crankcase heater. The compressor crankcase heater is always on when the compressors are de-energized. This protects the system against refrigerant migration, oil dilution and potential compressor failure.

**DUAL-HIGH PRESSURE SWITCHES:** These switches provide an additional safety protection in the case of excessive discharge pressure.

**UNDER VOLTAGE AND PHASE PROTECTION:** Protects against low & high incoming voltage as well as single phasing, phase reversal and phase imbalance by de-energizing the control circuit. It is an automatic reset device, but it can be set up for manual reset.

**MOULDED CASE CIRCUIT BREAKER:** Protects against circuit fault. When tripped (automatically or manually), the breaker opens the power supply to total circuit quickly.

**INDICATOR LIGHTS:** Three lights indicates power ON, Status and Communication.

**ELECTRONIC EXPANSION VALVE:** Electronic expansion valve is used to regulate the refrigerant flow to the water cooler and maintain a constant superheat and load optimization.

**FILTER DRIER (REPLACEABLE CORE TYPE):** Refrigerant circuits are kept free of harmful moisture, sludge, acids and oil contamination particles by the filter drier.

**SIGHT GLASS:** A moisture indicating sight glass is installed in the liquid line. An easy-to-read color indicator shows moisture contents and provides a mean for checking the system refrigerant charge.

**PRESSURE GAUGES:** Suction & discharge pressures gauges.

## Options

**WATER FLOW SWITCH:** Water flow switch to protect the evaporator need to connect for upright mounting in horizontal pipe. (Field mounted)

**VIBRATION ISOLATION:** Neoprene Isolation – Recommended for normal installations and provides good performance in most applications for the least cost. (Field mounted)

Spring Isolators – Level adjustable, spring and cage type isolators for mounting under the unit base rails. 1" nominal deflection may vary slightly by application. (Field mounted)

**ANTI-CORROSION FINS CONDENSER :** provide corrosion resistance comparable to copper-fin coils in typical seashore locations.

The following safety devices are equipped as standard.

- High pressure protection
- Low pressure protection
- Compressor overload protection
- Fans overload protection
- High discharge temp. protection
- Power failure protection
- Contact protection
- Water flow protection
- Motor protection
- Low oil level protection
- Differential pressure protection

Safety protection device

**Notes:**

- 1) Nominal cooling capacities are based on the following conditions: Chilled water inlet/outlet temp: 12°C/7°C; Outdoor temp (DB/WB):35°C/24°C.
- 2) The applicable ambient temperature range of R134a air-cooled screw units is 15°C ~ 52°C, please refer to the technical manual for detailed performance table.
- 3)The factory keeps the right to improve the product and parameter without notice. Please refer to the actual parameter on the nameplate.
- 4) Caution: noise preventer required.

# Selection procedure

## Design Requirements

The following design requirement must be known to select a proper package chiller.

- 1. Required cooling capacity in kilowatt (kW)
- 2. Leaving chilled water temperature in °C (LWT)
- 3. Chiller water flow rate
- 4. Design ambient temperature
- 5. Maximum and minimum ambient temperatures
- 6. Altitude
- 7. Electrical power supply

ELEVATION ABOVE SEA LEVEL(Meter)	CAPACITY CORRECTION FACTOR
0	1.000
300	0.997
600	0.994
900	0.990
1200	0.987
1500	0.983
1800	0.979

## Sample selection

Select an air cooled chiller for the following conditions:

Required system capacity is 510kW at 7°C leaving chilled water. Design ambient temperature is 46°C. Altitude is 600 meter above sea level.

Water cooler fouling factor is 0.086. Power supply : 380V-3Ph-50Hz

### >>> Step-1:unit selection

Enter the capacity performance data at given LWT and ambient temperature. LSBLGCW600/Q(T3) chiller unit at sea level will produce 516.8kW and 226.8 kW power input at 7°C leaving water temperature and 46°C ambient temperature. For the conditions required, the unit actual cooling capacity when corrected for altitude (0.994) Capacity = 516.8 × 0.994 = 513.7 kW, which then exceeds the requirements. So the selection is correct.

### >>> Step-2:electrical

Refer to electrical data at 380V-3Ph-50Hz, the main power wire size for LSBLGCW600/Q(T3) is to be sized for a maximum running current of 534 Amps.

### >>> Step-3:chilled water pump selection

For chilled water pump selection, add all pressure drop in the closed chiller water loop piping to the pressure drop.

# Applicable range

Content	Running range
Ambient TEMP.	Tropical Application: 15°C~52°C
Out water TEMP.	5°C~15°C
Max inlet/outlet water TEMP. difference	8°C
Voltage tolerance	Rating Voltage±10%
Power supply frequency	Rating frequency±2%
Compressor max. start count	4 times per hour
Environment quality	High corrosive environment and high humidity should be avoid.

# Performance data

Unit Model	Ambient Temperature/°C

# Typical schematic wiring diagram

# Application guidelines

## Introduction

These guidelines should be considered when designing systems and their installation utilizing air-cooled chillers. Stable operation, performance and reliability of units is often dependent upon proper compliance with these recommendations.

## Unit selection/ sizing

Unit selection procedure and capacities are provided in this catalog for proper selection. The electronic selection program may also be utilized for this purpose.

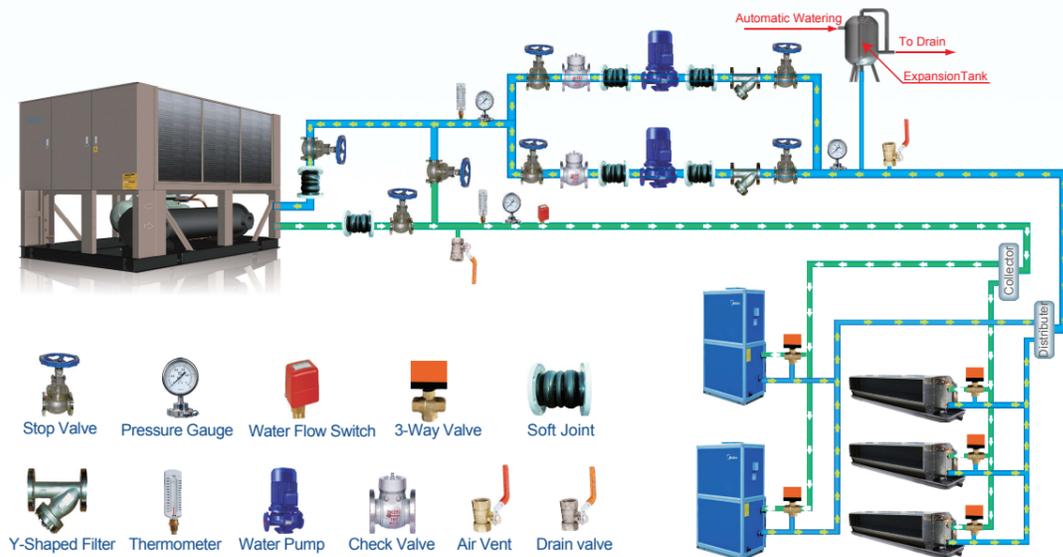

Over sizing chillers beyond a maximum limit of 5-10% in order to assure adequate capacity or considering future expansions is not recommended. Over sizing adversely affects the operating efficiency due to erratic system operation and excessive compressor cycling which also results in reduced compressor life. It should be noted that, units operate more efficiently when fully loaded rather than larger equipment operating at partial capacities. In addition, an oversized unit is usually more costly to purchase, install and operate.

Operation of two chillers at higher loading is preferred to operating a single chiller at or near its minimum possible capacity.

## Effect of altitude on unit capacity

The tabulated performance data provided in this catalog are for use at or near sea level altitude application. At altitudes substantially above sea level, the decreased air density will reduce condenser capacity and therefore unit capacity. For unit selection at these higher altitudes, apply appropriate correction factor from the table provided in this catalog.

## Typical water piping layout

## Introduction

The following pertinent guidelines are served to ensure satisfactory operation of the units. Failure to follow these recommendations may cause improper operation and loss of performance, damage to the unit and difficulty in servicing and maintenance.

- Water piping must be connected correctly, water must enter from the inlet connection on the cooler and leave from the outlet connection.
- The flow switch must be arranged at the outlet pipe of the cooler and interlocked with the input contact in the control cabinet. The straight pipe section at each side of the flow switch shall have a length that is at least 5 times the pipe diameter; do not install it near the elbow, orifice plate or valve.
- The water system must be fitted with the water pump with appropriate displacement and pressure head, so as to ensure normal water supply to the unit. The soft connection shall be used between the water pump, unit and water system pipelines, and the bracket shall be provided to avoid stress on the unit. Welding work for installation shall avoid damage to the unit.
- The water filter must be installed before the water inlet pipeline of the unit, which shall be provided with a 40-mesh screen. This will aid in preventing foreign material from entering and decreasing the performance of the cooler.
- Each low point shall be fitted with a drain connection so as to drain the remaining water in the system.
- The auto discharge air valve shall be arranged between the high point of the pipeline and the expansion tank. Hand shut-off valves are recommended for use in all lines to facilitate servicing.
- The thermometer and pressure gauge are arranged on the straight pipe sections of the water inlet pipeline and drain pipeline, and their installation places shall be far away from the elbows.
- The flushing and insulation of the water pipelines shall be carried out before it is connected with the unit, so as to prevent dirt from damaging the unit.

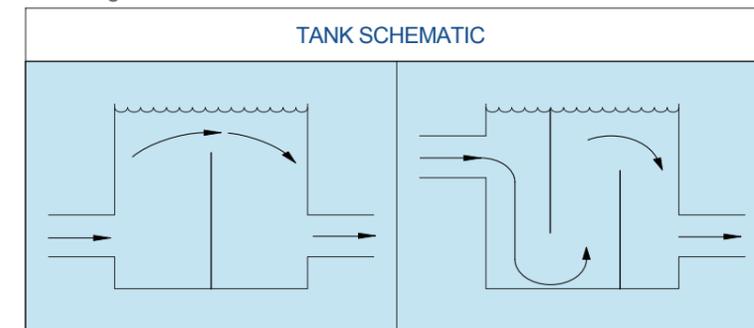

## Chilled fluid volume requirement

The volume of water in a piping system loop is critical to the smooth and proper operation of a chilled water system. If sufficient volume of water is not there in the system, the temperature control can be lost resulting in erratic system operation and excessive compressor cycling.

$$V(\text{Liters}) = \text{CAP}(\text{kW}) \times N$$

Note: CAP -- Nominal cooling capacity (kW) N = 7.17

To achieve the aforementioned water volume requirements, it may be necessary to install a tank in the piping system loop to increase the volume of water in the system and therefore, reduce the rate of change of return water temperature. This tank should be provided on the return water side to the chiller and the tank should be baffled to ensure that there is no stratification and the entering stream thoroughly mixes with the tank water. See recommended tank design schematics below.

# Microprocessor controller

## Sequence of operation:

The following describes the sequence of operation for a two screw compressor chiller unit. Operation is similar for a one or more compressor unit. For initial start-up, the following conditions must be met:

- The power supply to the unit shall be energized for 8 hours in advanced.
- All safety conditions satisfied.
- Chilled water pump running and chilled water flow switch contact closed.
- Customer interlock contact closed, if any.

## Stage - on sequence

Stage ON & OFF sequence, shall be accomplished by the Leaving water temperature control selection.

### Stage # 1:

If the leaving water temperature is in loading area, the compressor # 1 electronic expansion valve shall be switched ON. Now the compressor is in the minimum or unloaded capacity. The compressor capacity is varied to achieve the full/part load capacity as per the load demand.

As discharge pressure of compressor # 1 rises, the corresponding fans are energize accordingly to the fan stage-ON set point. If the discharge pressure falls below the fan stage-OFF set point value, the corresponding fans will turn off.

### Stage # 2:

If the compressor has loaded in 50% and entered capacity adjustment program, the leaving water temperature still be in loading area, the compressor #2 electronic expansion valve shall be switched ON. Now the compressor capacity is varied to achieve the full/part load capacity as per the load demand.

As discharge pressure of compressor # 2 rises, the corresponding fans are energize accordingly to the fan stage-ON set point. If the discharge pressure falls below the fan stage-OFF set point value, the corresponding fans will turn off.

## Stage - off sequence

During the staging OFF, the first- in- first – out sequence is adopted.

As the applied load decreases and when the leaving water temperature falls in unloading area, the compressor #1 shall unload.

If the leaving water temperature still be in unloading area, the compressor # 2 shall unload.

If both of the two compressors have unloaded to 50% status, and the leaving water temperature still be in unload area, the compressor # 1 shall be turned off firstly.

# Rigging instructions

## Attention to riggers:

Hooking rigging sling thru holes in base rail, as shown below.

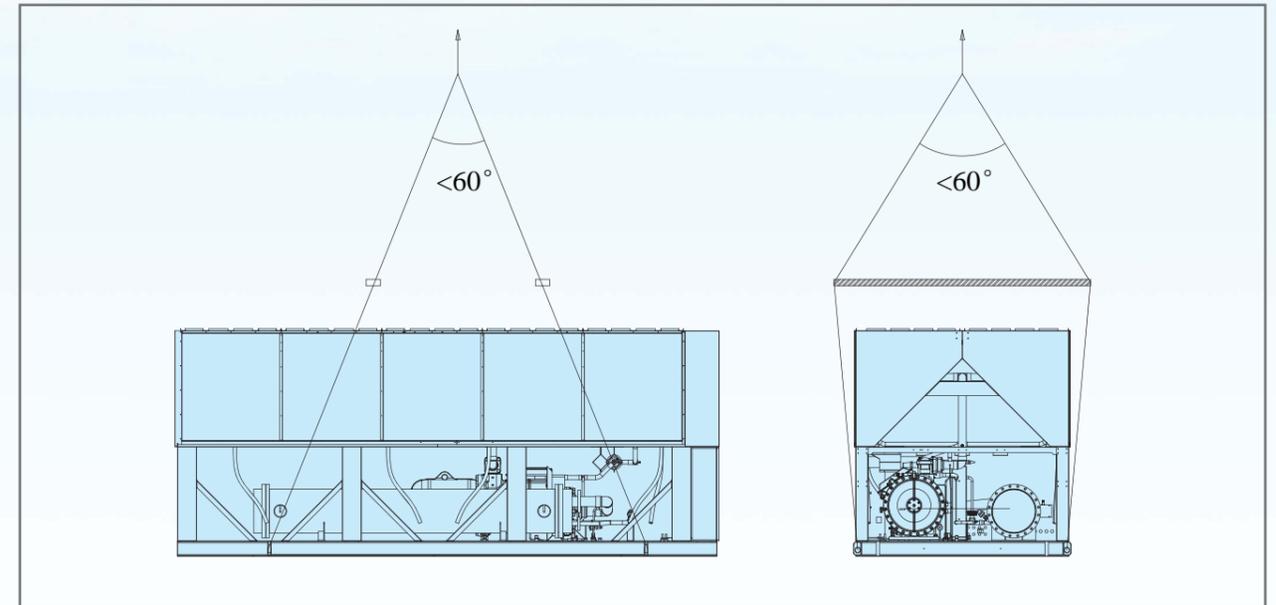

Center of gravity is not unit center line. Ensure center of gravity aligns with the main lifting point before lifting.

Use spreader bar when rigging, to prevent the slings from damaging the unit.

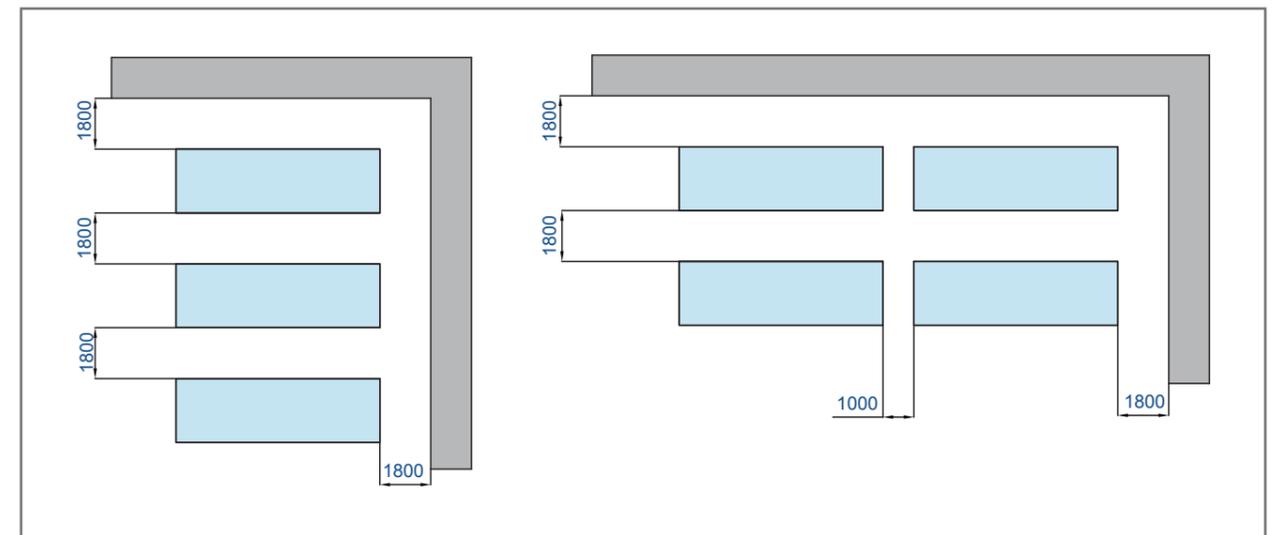

## Caution:

All panels should be in place when rigging. Care must be taken to avoid damage to the coils during handling.

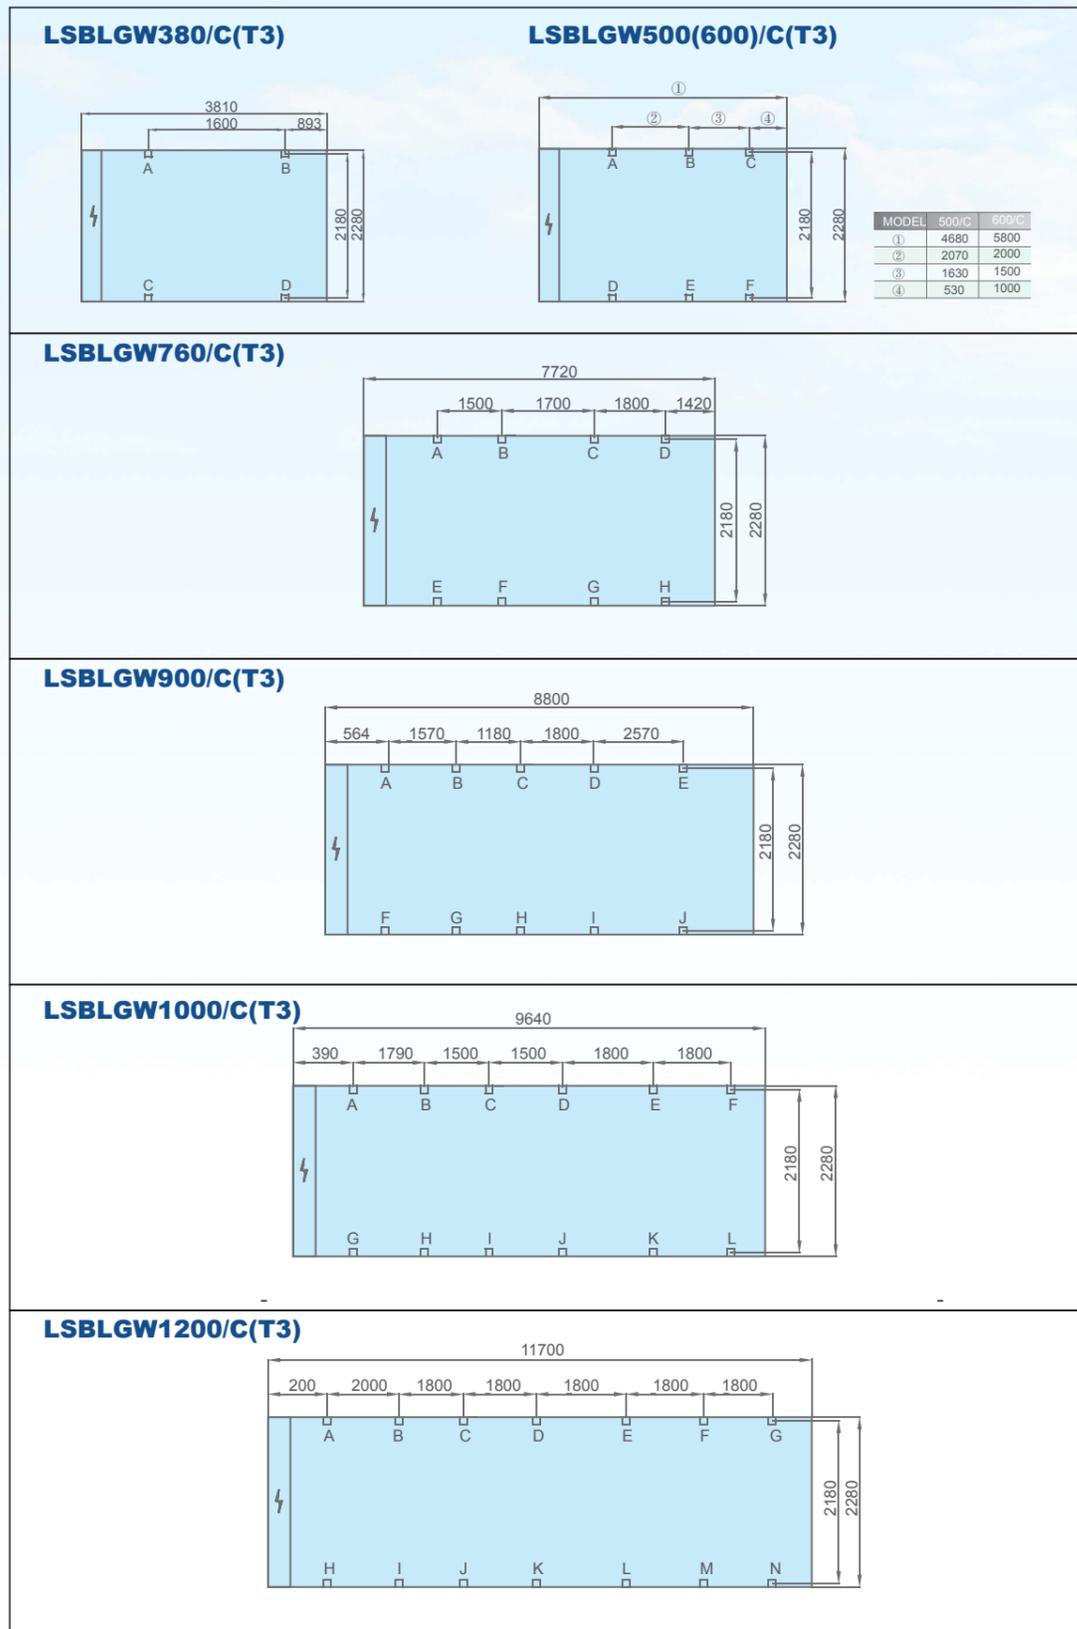

Insert packing material between coils & slings as necessary.

## Installation requirements:

- 1. Be sure to take the base preparation and structure into consideration seriously during installation, especially avoid the intensity and noise of floor when the machine is installed on the top story of buildings. It is recommended to discuss with the building designer before conducting installation.
- 2. The surrounding of the base shall be equipped with drainage ditch and make sure it can dewatering freely for convenient in drain.
- 3. Anti-vibration pad shall be placed between the base frame and foundation in order to avoid transmitting vibration and noise during the runtime of the unit, and make sure the unit is acclinic during installation.

# Troubleshooting guide

## 1. Unit Touch Screen Fault

- Check whether emergency switch (SB) is normal, has been reset.
- Check whether air switch (QF) be in "ON" status, the fuse is normal.
- Check whether the wiring of the power line and communication line are correct, and the bolt has been tightened.
- Check whether the wiring of isolation transformer is correct, and the component is normal.
- Check whether the switch power is normal.

## 2. Power Protection

- Check whether the setting parameters of the phase relay are correct.
- Check whether the wiring of phase sequence relay is correct.
- Check the wiring of power is correct.
- Check the power quality.

## 3. Temperature Sensor Failure

- Check whether the wiring is correct
- Check whether the resistance of temperature sensor is normal.

## 4. Pressure Sensor Failure

- Check whether the wiring of suction and discharge pressure sensors is correct.
- Check whether the setting range on touch screen is corresponding with the range marked on the sensor.
- Check whether the correction value is correct.

## 5. Compressor Overload Protection

- Check whether the setting value of compressor thermal overload relay is correct.
- Check whether the overload relay itself is normal.
- Check the quality of power supply.
- Check whether the load is normal.
- Check whether supply oil system of compressor is normal.

## 6. Oil level Protection

- Check whether the oil level switch or connection is failure
- Check whether there is refrigeration oil leakage.
- Check whether the unit has run with liquid and some oil is taken away from the compressor.

## 7. Fan Overload Protection

- Check whether the setting value of fan thermal overload relay is correct.
- Check whether the relay is normal.
- Check whether there is bad ventilation around the unit.
- Check whether the fan load is too heavy.
- Check whether the power is normal.

## 8. High Discharge Pressure Protection

- Check whether discharge pressure sensor itself and setting values are normal.
- Check whether the ambient temperature has exceeded allowed running range.
- Check whether all of valves have been open fully.
- Check whether the condenser is normal.
- Check whether the fans are normal
- If all mentioned above are normal, but the alarm still exist. Maybe there exists non-condensable gas or too much refrigerant in the system.

## 9. Low Suction Pressure Protection

- Check whether all valves have been open fully, such as suction and discharge shutoff valves, angle valves or ball valves on two sides of the filter.
- Check whether the opening of EXV is normal.
- Check whether suction temperature sensor is normal and the installation meet the requirement.
- Check whether there is plugging in the filter.
- Check whether there is a leakage of refrigerant.
- Check whether the chilled water system is normal.

## 10. High Discharge Temperature Protection

- Check whether discharge temperature is normal.
- Check whether ambient or water temperature is excess allowed range.
- Check whether the injection system is normal.
- Check whether the filter is normal.
- Check whether EXV is normal.
- Check whether the refrigeration oil is normal.

## 11. Water Flow Fault Protection

- Check whether the type of water pump can meet the requirement;
- Check whether the water pump run normally and the wiring is correct;
- Check whether the water flow reaches to allowed range.
- Check the direction of the targets is normal and the installation of water flow switch meet the requirement.
- Check whether the wiring of water flow switch is normal.
- Check whether the chilled water system is normal.

## 12. Anti-freeze Protection

- Check whether chilled leaving water temperature is less than 3℃.
- Check whether the wiring and water flow switch itself is normal.
- Check whether the chilled water system is normal.

## 13. Contactor Protection

- Check whether the setting value of time relay is correct.
- Check whether the wiring of contactors are normal.
